

## Python, II deo

How to Think Like a Computer Scientist  
Learning with Python

Allen Downey, Jeffrey Elkner, Chris Meyers  
Green Tea Press, Wellesley, Massachusetts

© Predrag Pejović, 

### ... i jedan citat:

### Python, dosta kalkulatora: programiranje!

strana 90:

... One of the characteristics of algorithms is that they do not require any intelligence to carry out. They are mechanical processes in which each step follows from the last according to a simple set of rules.

In our opinion, it is embarrassing that humans spend so much time in school learning to execute algorithms that, quite literally, require no intelligence.

On the other hand, the process of designing algorithms is interesting, intellectually challenging, and a central part of what we call programming.

- ▶ pokrenete IDLE
- ▶ File, New File (Ctrl + N)
- ▶ kucate program
- ▶ sintaksna provera: Run, Check Module (Alt + X)
- ▶ start programa: Run Module (F5)

### Python, for petlja, continue

### Python, for petlja, da dodamo i break

```
a = []
for i in range(100):
    if i % 4 != 0:
        a.append(i)
        continue
    print 'izbacen', i
print
print a
```

```
a = []
for i in range(100):
    if i % 4 != 0:
        a.append(i)
        continue
    print 'izbacen', i
    if (i+1) % 77 == 0:
        break
print
print a
```

### Python, input

### Python, raw\_input

```
x = input('unesi neki podatak: ')
print type(x)
print x
probati: 1, 3.0, 'podatak'
```

```
x = raw_input('unesi neki podatak: ')
print type(x)
print x
probati: 1, 3.0, 'podatak'
```

## Python, formatted print

calculator mode, again

```
print '{'
print '}'
print '{}.format('Pera')
print '{}, {}'.format('Mika', 'Laza')
print '{0}, {1}'.format('Mika', 'Laza')
print '{1}, {0}'.format('Mika', 'Laza')
print '{1}, {1}'.format('Mika', 'Laza')
```

## Python, formatted print, brojevi

```
print 'p = {}, q = {}'.format(3, 4)
print 'p = {}, q = {}'.format(3.0, 4)
print 'p = {}, q = {}'.format(3, 4)
import math
print 'pi = {:.2f}'.format(math.pi)
print 'pi = {:.5f}'.format(math.pi)
print 'pi = {:.10.5f}'.format(math.pi)
print 'n = {:10d}'.format(100)
print 'n = {:.4d}'.format(100)
print 'n = {:.3d}'.format(100)
print 'n = {:1d}'.format(100)
```

ima još mogućnosti, pogledajte Tutorial  
postoji i formatiranje sa %, staro (next slide)  
koristiti str.format() metod za nove programe!

## Python, formatted print, stari sistem

```
print 'pi = %5.3f' % math.pi
print 'pi = %7.4f' % math.pi
n = 9
print 'polagalo je %d studenata' % n
print 'polagalo je %10d studenata' % n
```

vuće se po starim programima  
izbegavati!

## Python, stringovi, još ponešto

```
a = 'Petar'
b = 'Marko'
len(a); len(b)
a + b
a * 3
3 * a
(a + 2 * b) * 3
a - b
a == a
a == b
a < b
b < a
'1' < '2'
'1' < 2
```

## Python, nije sve u matematici (?)

```
import string as s
dir(s)
help(s)
s.ascii_letters
s.printable
s.uppercase
s.digits
s.octdigits
```

## Python, string methods

```
del s

'Pera'.upper()
'Pera'.lower()
'Pera'.center(20)
'Pera'.isalpha()
'Pera6'.isalpha()

'kako da ne'.capitalize()
'kako da ne'.title()
'kako da ne'.split()
```

i tako dalje, manual for string methods, pogledajte pre nego što  
reinvent

## Python, OŠ, 1

Vreme je za zadatak:

- ▶ ulazni podatak je broj,  $n < 20$  (npr.)
- ▶ treba odštampati LEPU (formatiranu) tablicu množenja

Polako, sada imamo preča posla ...

## Python, files, pisanje

```
f = open('proba.txt', 'w')
print f
type(f)
f
f.write('prvi red\n')
f.write('drugi red\n')
f.write('treci red\n')
f.close # metod, obavezne()
f.close()
type(f)
f
```

pogledajte fajl proba.txt

## Python, files, čitanje

```
f = open('proba.txt', 'r')
print f
f
type(f)
a = f.read()
a
print a
f.close()
f
```

## Python, files, čitanje po 10 bajtova

```
f = open('proba.txt', 'r')
f.read(10)
f.read(10)
f.read(10)
f.read(10)
f.close()
```

## Python, files, čitanje po redovima

```
f = open('proba.txt', 'r')
f.readline()
f.readline()
f.readline()
f.readline()
f.readline()
f.close()
```

## Python, OŠ, 2

Vreme je za zadatak:

- ▶ ulazni podatak je broj,  $n < 20$  (npr.)
- ▶ treba formirati LEPU (formatiranu) tablicu množenja
- ▶ i zapisati je u .txt file

Polako, još uvek imamo preča posla ...

## Python, OOP

OOP, Python's middle name

- ▶ korisnik definiše svoje tipove podataka, klase
- ▶ nad definisanim podacima definiše funkcije, tzv. metode, već ih videli na delu
- ▶ čisto i pregledno
- ▶ može, a ne mora
- ▶ šteta propustiti

## Python, class

kucate u editoru, kada završite proverite sintaksu i izvršite, to su Alt+X i F5

```
class Vector:
    pass
```

## Python, OOP, konvencije za dalje ...

- ▶ pokrenete IDLE, tu je **interpreter**
- ▶ otvorite **editor**: File, New Window, ...
- ▶ ono što kucate u interpreteru je **crveno**
- ▶ ono što kucate u editoru je **plavo**
- ▶ kucate "as is", kreativnost za sada nije na ceni
- ▶ file neka se zove **vector.py**

## Python, class

```
type(Vector)
a = Vector()
type(a)
print a
a.x = 1
a.y = 2.0
a.z = 3j
type(a.x)
type(a.y)
type(a.z)
print a.x, a.y, a.z
del a
type(a.x)
```

## Python, class help

```
help(Vector)

class Vector:
    """Vector(x, y, z)

    klasa koja definise vektore
    i operacije nad njima"""

note: nema više pass!

help(Vector)
```

## Python, inicijalizacija, dodajemo na class, help string ostaje

inicijalizacija i se dodaje u class file, vector.py pazite na indent, inicijalizacija i class isto!

4 argumenta?

```
type(i)
print i
print i.x, i.y, i.z

x = Vector()
```

## Python, string method, lepo prikazivanje instance

dodajete samo funkciju:

```
class Vector:
    ...
    def __str__(self):
        return 'Vector(' + str(self.x) + ', ' + \
               str(self.y) + ', ' + str(self.z) + ')'

help(Vector)
print i
print j
a = Vector(2, 2, 0)
print a
```

## Python, operator overloading, oduzimanje vektora

```
class Vector:
    ...
    def __sub__(self, other):
        return Vector(self.x - other.x,
                     self.y - other.y,
                     self.z - other.z)

help(Vector)
print i - j
print i - j - k

print Vector.__sub__(k, j)
print k.__sub__(j)
```

## Python, inicijalizacija, dodajemo na class, help string ostaje

```
class Vector:
    ...
    def __init__(self, x, y, z):
        self.x = x
        self.y = y
        self.z = z

i = Vector(1, 0, 0)
```

## Python, inicijalizacija, default

```
class Vector:
    ...
    def __init__(self, x = 0, y = 0, z = 0):
        self.x = x
        self.y = y
        self.z = z

i = Vector(1, 0, 0)
j = Vector(0, 1, 0)
k = Vector(0, 0, 1)

x = Vector()
print x.x, x.y, x.z
print i.x, i.y, i.z
help(Vector)
```

## Python, operator overloading, sabiranje vektora

```
class Vector:
    ...
    def __add__(self, other):
        return Vector(self.x + other.x, self.y + \
                     other.y, self.z + other.z)

help(Vector)
print i + j
print i + j + k

print Vector.__add__(i, j)
print i.__add__(j)
```

## Python, da zakomplikujemo malo ...

```
u interpreteru:

def sv(a, b):
    return a + b

print sv(i, j)
print sv(3, 4)
sv
type(sv)

del sv

sv = Vector.__add__
sv
type(sv)

print sv(i, j)
print sv(3, 4)
```

## Python, opet operator overloading, negativni vektor

```
class Vector:  
    ...  
    def __neg__(self):  
        return Vector(-self.x, -self.y, -self.z)  
  
help(Vector)  
print -i  
print -(-i)  
  
print Vector.__neg__(k)  
print k.__neg__()
```

## Python, apsolutna vrednost

```
class Vector:  
    ...  
    def absval(self):  
        return math.sqrt(self.x ** 2 + \  
                         self.y ** 2 + self.z ** 2)  
  
help(Vector)  
help(Vector.absval)  
i.absval  
i.absval()  
import math  
i.absval()  
Vector.absval(i)  
a = Vector(2, 2, 0)  
a.absval(); Vector.absval(a); a.absval() ** 2  
a.x
```

## Python, skalarni (dot) proizvod

```
class Vector:  
    ...  
    def dotprod(a, b):  
        dp = a.x * b.x + a.y * b.y + a.z * b.z  
        return dp  
  
print Vector.dotprod(i, j)  
print Vector.dotprod(j, i)  
a = Vector(2, 2, 0)  
print a.dotprod(j)  
print a.dotprod(k)  
a.dotprod(k).pr()  
k.dotprod(i).pr() # zašto ne radi?
```

## Python, overloaded \*

```
class Vector:  
    ...  
    def __mul__(self, other):  
        return Vector.dotprod(self, other)  
  
print i * 3  
print i * i  
print i * j  
print i * k  
print i.__mul__(i)  
(i * i).pr()  
i * i  
i * j
```

## Python, štampanje kao metod

```
class Vector:  
    ...  
    def pr(self):  
        print self  
  
help(Vector)  
help(Vector.pr)  
i.pr  
i.pr()  
Vector.pr(i)  
k.__neg__().pr()
```

## Python, vektorski proizvod

```
class Vector:  
    ...  
    def vecprod(self, other):  
        x = self.y * other.z - self.z * other.y  
        y = self.x * other.z - self.z * other.x  
        z = self.x * other.y - self.y * other.x  
        return Vector(x, y, z)  
  
print Vector.vecprod(i, j)  
print Vector.vecprod(j, i)  
print i.vecprod(j)  
print j.vecprod(i)  
i.vecprod(j).pr()  
j.vecprod(i).pr()
```

## Python, proizvod množenja skalarom

```
class Vector:  
    ...  
    def scalprod(self, other):  
        return Vector(self.x * other, \  
                      self.y * other, self.z * other)  
  
print Vector.scalprod(i, 3)  
print Vector.scalprod(3, i)  
print k.scalprod(3)  
print 3.scalprod(k)  
j.scalprod(3).pr()  
3.scalprod(i).pr()  
a = 3  
a.scalprod(i).pr()
```

## Python, overoverloaded \*

```
class Vector:  
    ...  
    def __rmul__(self, other):  
        return Vector.scalprod(self, other)  
  
print 3 * i  
print i * 3  
print i * j  
print i * i  
print i.__rmul__(3)  
i.__rmul__(3).pr()
```

## Python, a sada poređenje, 1

```
class Vector:  
    ...  
    def __cmp__(self, other):  
        a = self.absval()  
        b = other.absval()  
        if a > b:  
            return 1  
        elif a < b:  
            return -1  
        else:  
            return 0
```

## Python, a sada poređenje, 2

```
a = Vector(2, 2, 2)  
a > i  
a == i  
a < i  
i > i  
i == i  
i != i  
i < i  
i == j  
i == k
```

I ovo je kraj priče o vektorima, nema više red i blue!

## Python, class and object variables

```
class Brojac:  
    broj = 0  
    def __init__(self):  
        Brojac.broj += 1  
        print 'sada ih ima', Brojac.broj  
    def __del__(self):  
        Brojac.broj -= 1  
        print 'sada ih ima', Brojac.broj
```

## Python, class and object variables, primena

```
a = Brojac()  
b = Brojac()  
c = Brojac()  
d = Brojac()  
del c  
a = Brojac()      # pise, pa briše  
del a  
del d  
del b
```

## Python, a sada nešto sasvim različito, map

```
x = range(11)  
print x  
def sq(a):  
    return a ** 2  
  
y = map(sq, x)  
print y
```

## Python, a sada nešto neočekivano

```
help([])  
help(())  
help({})  
a = (1, 2, 3, 4, 5)  
a[0]  
a[3]  
a[2] = 5
```

## Python, dictionary

```
t = {'peja': 313, 'laza': 312, 'dule': 311}  
print t  
print t['peja']  
t['peja'] = 314  
print t  
del t['peja']  
print t  
'dule' in t  
'peja' in t  
t.keys()  
t['peja'] = 313  
print t
```

## Python, sets

```
a = 'abracadabra'  
b = 'alacazam'  
x = set(a)  
print x  
y = set(b)  
print y  
x - y  
y - x  
x | y  
x & y  
x ^ y
```

## Python, exceptions, 0

```
def reciproc(x):
    try:
        return 1 / float(x)
    except:
        print 'Houston, we have a problem!'
```

## Python, exceptions, 1

```
def reciproc(x):
    try:
        return 1 / x
    except ZeroDivisionError:
        print 'delis nulom!'

recipro(3)
recipro(3.)
recipro(0)
recipro(0.)
recipro('a ovo?')
```

## Python, exceptions, 2

```
def reciproc(x):
    try:
        return 1 / float(x)
    except ZeroDivisionError:
        print 'delis nulom!'
    except ValueError:
        print 'nije dobar broj'

recipro(3)
recipro(3.)
recipro(0)
recipro(0.)
recipro('a ovo?')
recipro(1+0j)
```

## Python, exceptions, 3

```
def reciproc(x):
    try:
        return 1 / float(x)
    except ZeroDivisionError:
        print 'delis nulom!'
    except (ValueError, TypeError):
        print 'nije dobar broj'

recipro(3)
recipro(3.)
recipro(0)
recipro(0.)
recipro('a ovo?')
recipro(1+0j)
```

## Python, exceptions, 4

- ▶ “built-in” exceptions?
- ▶ <http://docs.python.org/2/library/exceptions.html>
- ▶ ovo je samo početak ...
- ▶ možete sami da definišete exception ...
- ▶ ili da raise exception ...
- ▶ ako vas zanima  
<http://docs.python.org/2/tutorial/errors.html>

## Python, start programa

```
python ime_programa.py
ili
./ime_programa.py
akko je PRVA linija programa:
#! /usr/bin/python
i ako je urađeno
chmod +x ime_programa.py
čega se sećate, naravno; da izbegnete ./ dopunite PATH
```

## Python, encoding, 1

```
#!/usr/bin/python

print 'ja se ne zovem Čedomir Š. Petrović'
print 'ja se zovem Предраг Пејовић'
```

## Python, encoding, 2, mora drugi red!

```
#!/usr/bin/python
# -*- coding: utf-8 -*-

print 'ja se ne zovem Čedomir Š. Petrović'
print 'ja se zovem Предраг Пејовић'
```

```
print '\n\n\n'  
print r'\n\n\n'  
print '\\\\n\\\\n\\\\n'  
  
from __future__ import division  
i  
from __future__ import unicode_literals
```

## Python, nije kraj, ovo je početak!

- ▶ ima još mnogo toga, ovo je samo osnova
- ▶ pre svega biblioteke, moduli ...
- ▶ mnogo toga je gotovo, vaša je primena!
- ▶ razlika 2 i 3
- ▶ od sledeće godine 3?
- ▶ ostaju numpy, matplotlib, ipython, pylab, sympy
- ▶ a sada: tablica množenja
